A CRM Application For Banquet Hall Booking

Salesforce Developer Account SetUp

- **Description**

Introduction:

Are you new to Salesforce? Not sure exactly what it is, or how to use it? Don't know where you should start on your learning journey? If you've answered yes to any of these questions, then you're in the right place. This module is for you.

Welcome to Salesforce! Salesforce is game-changing technology, with a host of productivity-boosting features, that will help you sell smarter and faster. As you work toward your badge for this module, we'll take you through these features and answer the question, "What is Salesforce, anyway?".

What Is Salesforce?

Salesforce is your customer success platform, designed to help you sell, service, market, analyze, and connect with your customers.

Salesforce has everything you need to run your business from anywhere. Using standard products and features, you can manage relationships with prospects and customers, collaborate and engage with employees and partners, and store your data securely in the cloud. So what does that really mean? Well, before Salesforce, your contacts, emails, follow-up tasks, and prospective deals might have been organized something like this:

Objects

Creating 3 Objects

- **Description**
- **Creating a Banquet Hall Object**
- The purpose of creating a Banquet Hall custom object is to store and manage information about Banquet Hall Bookings.
- To create an object:
- From the setup page
- Click on Object Manager
- Click on Create → Click on Custom Object.
- Enter the label name→ Banquet Hall
- Enter Plural label name→Banquet Halls
- Enter Record Name → Customer Name
- Select Data Type as Text.
- Select Allow reports.
- Select Allow search.
- Click on Save and New

SETUP

New Custom Object

Custom Object Definition Edit

Save | Save & New | Cancel

Custom Object Information

* = Required Information

The singular and plural labels are used in tabs, page layouts, and reports.

Label: Banquet Hall — Example: Account

4

Plural Label: Banquet Halls — Example: Accounts

5

Starts with vowel sound: ☐

The Object Name is used when referencing the object via the API.

Object Name: Banquet_Hall — Example: Account

Description:

Context-Sensitive Help Setting:
- (●) Open the standard Salesforce.com Help & Training window
- ( ) Open a window using a Visualforce page

Content Name: --None--

Activate Windows
Go to Settings to activate Windows.

SETUP

New Custom Object

Enter Record Name Label and Format

The Record Name appears in page layouts, key lists, related lists, lookups, and search results. For example, the Record Name for Account is "Account Name" and for Case it is "Case Number". Note that the Record Name field is always called "Name" when referenced via the API.

6 Record Name: Customer Name Example: Account Name

7 Data Type: Text

Optional Features

- [x] Allow Reports 8
- [ ] Allow Activities
- [ ] Track Field History
- [ ] Allow in Chatter Groups
- [ ] Enable Licensing

Object Classification

When these settings are enabled, this object is classified as an Enterprise Application object. When these settings are disabled, this object is classified as a Light Application object. Learn more.

- [x] Allow Sharing
- [x] Allow Bulk API Access
- [x] Allow Streaming API Access

Activate Windows

Tabs

Activity 1: Creating a tab for Banquet Hall Object

- **Description**
- Go to the setup page → type Tabs in Quick Find bar
- Click on tabs
- Click on New (under custom object tab).
- Select Object(Banquet Hall) → Select the tab style
- Click on Next →(Add to profiles page) keep it as default →Click on Next (Add to Custom App) uncheck the include tab .
- Make sure that the Append tab to users' existing personal customizations is checked.
- Click save

Custom Tabs
Help for this Page
You can create new custom tabs to extend Salesforce functionality or to build new application functionality.
Custom Object tabs look and behave like the standard tabs provided with Salesforce. Web tabs allow you to embed external web applications and content within the Salesforce window. Visualforce tabs allow you to embed Visualforce pages. Lightning Component tabs allow you to add Lightning components to the navigation menu in Lightning Experience and the mobile app. Lightning Page tabs allow you to add Lightning Pages to Lightning Experience and the mobile app.

Activity 4 : Creating Master Detail Relationship

- **Description**

- A Master Detail relationship is a type of relationship in Salesforce that connects two objects together based on a field known as the Lookup field. It establishes a relationship between a child object and a parent object, allowing the child object to reference the parent object.
- **To Create a relationship between Banquet Hall & Billing Objects.**
- Go to the Setup page → click on Object manager → type object name(Billing) in the quick find bar→ click on the object.
- Click on fields & relationship
- Click on New.
- Select “Master Detail relationship” as data type and click Next.
- Select the related object “ Banquet Hall”.
- Click on Next
- Give Field Label as “Customer Name” .
- Click on Next → Next → Next → Save.

•

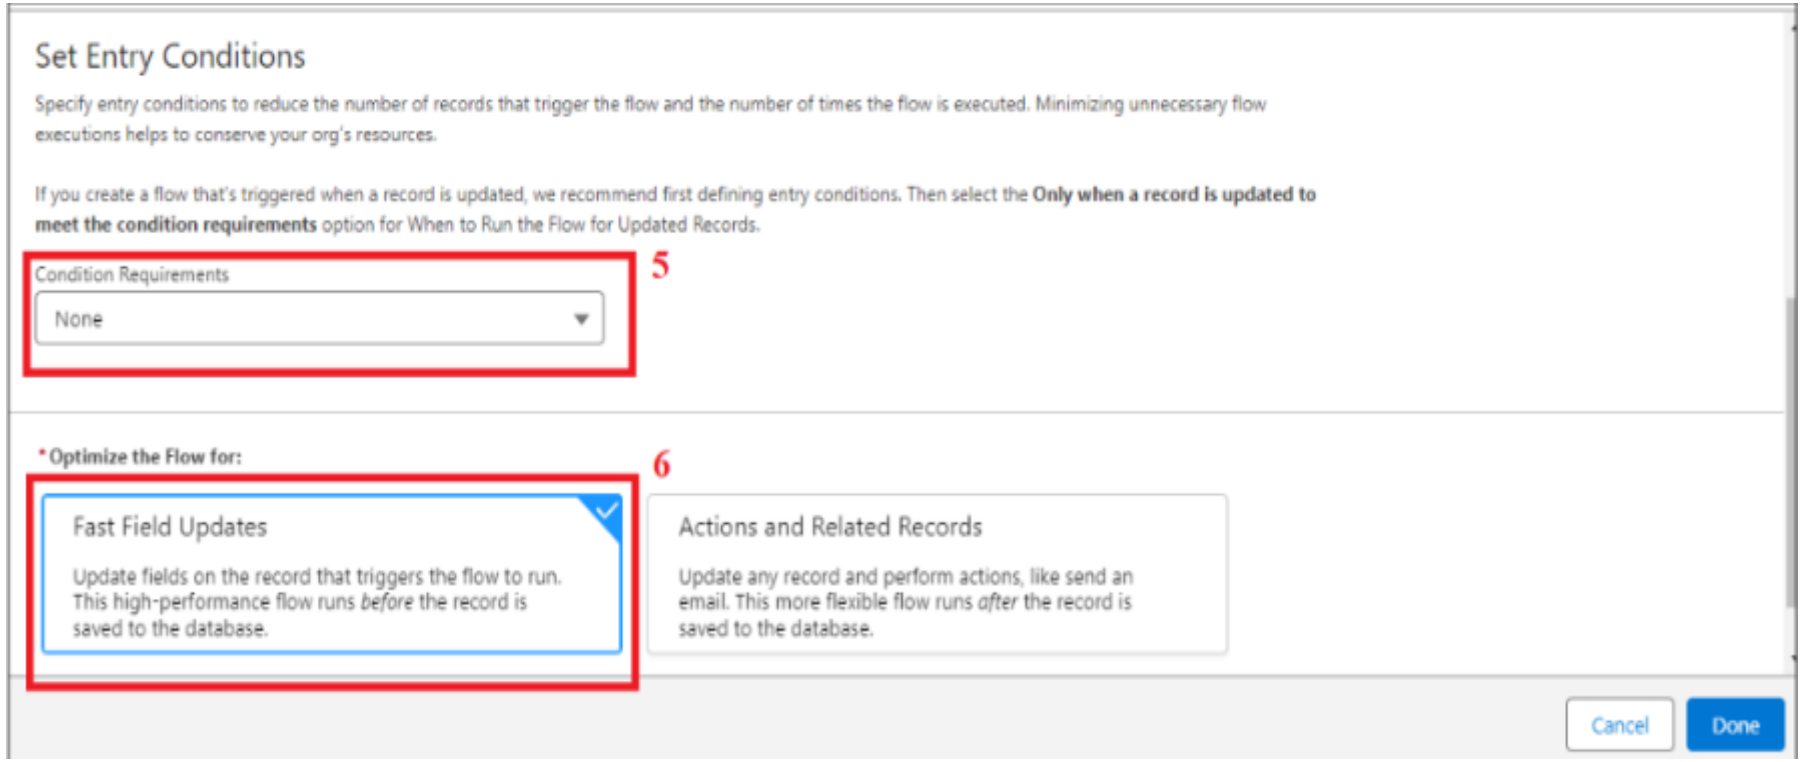
Flows

Activity 1 : Create Flow to check whether the same booking date and timings are already available.

- **Description**

- Go to setup → type Flow in quick find box → Click on the Flow and Select the New Flow.
- Select the record Triggered flow.Click on create.
- Under Object select “Banquet Hall”
- Select A record is created
- Set Entry Conditions : None
- Select Fast Field Updates
- Under the record trigger flow click on the “+” icon and select **Get Records.**
- Enter Label as “ Duplicate Checking for Banquet Hall ”.
- For Object select Banquet Hall

•



Set Entry Conditions
Specify entry conditions to reduce the number of records that trigger the flow and the number of times the flow is executed. Minimizing unnecessary flow executions helps to conserve your org's resources.
If you create a flow that's triggered when a record is updated, we recommend first defining entry conditions. Then select the Only when a record is updated to meet the condition requirements option for When to Run the Flow for Updated Records.
Condition Requirements
None
5
*Optimize the Flow for:
6
Fast Field Updates
Update fields on the record that triggers the flow to run. This high-performance flow runs before the record is saved to the database.
Actions and Related Records
Update any record and perform actions, like send an email. This more flexible flow runs after the record is saved to the database.

Triggers

Activity 1 : Create a Trigger for Automated Billing Creation upon Banquet Hall Creation

- **Description**
- **Step 1 :** Login to Salesforce:
- Log in to your Salesforce account with administrative privileges.
- **Step 2:**
- i)Navigate to Setup: Once logged in, click on the gear icon (Setup) located at the top-right corner of the page. This will open the Setup menu.
- ii)Click on Developer Console: Click on the "Developer Console" option from the Setup menu. This will open the Developer Console in a new browser tab or window.
- **Step 3:**
- 1) In the Developer Console window, go to the top menu and click on "File".
- 2)Select New: From the dropdown menu under "File", select "New".
- 3)Choose Apex Class: In the submenu that appears, select "Apex Class". This will open a new Apex Class editor tab.

-

- **Create an Apex Class:**

- public class BillingTriggerHandlerClass { Public Static Void BillingCreationonBooking(List<Banquet_Hall__c> bHallList){ List<Billing__c> billList = new List<Billing__c>(); for(Banquet_Hall__c bHall : bHallList){ Billing__c bil = new Billing__c(); bil.Customer_Name__c =bHall.Id; bil.Email__c = bHall.Email__c; billList.add(bil); } if(!billList.isEmpty()){ insert billList; } } }

- i) In the Developer Console window, go to the top menu and click on "File".
- ii)Select New: From the dropdown menu under "File", select "New".
- iii)Choose Apex Class: In the submenu that appears, select "Apex Trigger". This will open a new Apex Trigger editor tab.

- **Create an Apex Trigger:**
- trigger BillingRecordCreation on Banquet_Hall__c (after insert) { if(trigger.isInsert){ if(trigger.isAfter){ BillingTriggerHandlerClass.BillingCreationonBooking(trigger.new); } } }
